Air-laid web with hollow synthetic fibers

Abstract

The present invention relates to a single layer air-laid composition comprising: hollow synthetic fiber, absorbent and a binder system. The hollow fiber comprises from about 10 to about 50 percent by weight of said composition. The hollow synthetic fiber has a denier of between about 2 to about 18. The hollow synthetic fiber is selected from the class of polyolefins, polyesters, polyamides, acrylics, as well as mixtures and copolymers thereof. The absorbent comprises from about 40% to about 80% of the weight of said composition. The absorbent is a natural absorbent, or a synthetic absorbent, or a mixture of these. The natural absorbent is selected from the class of wood pulp fluff, cotton, cotton linters, and regenerated cellulose fibers, or a mixture of these. The synthetic absorbent is selected from the class of agar, pectin, guar gum, and synthetic hydrogel polymers. The binder fiber comprises from about 3 to about 15 percent by weight of said composition.

AIR-LAID WEB WITH HOLLOW SYNTHETIC FIBERS

RELATED APPLICATION

This application is a continuation-in-part of U.S.S.N. 10/345,001 filed January 15, 2003 in the name of Mabrouk Ouederni, which was itself a continuation-in-part of U.S.S.N. 09/896,799 filed June 29, 2001.

Correct

BACKGROUND OF THE INVENTION

1) FIELD OF THE INVENTION

The present invention relates to a single layer air-laid composition useful as an absorbent core in diapers, incontinent pads, sanitary napkins and other absorbent pads needed for body fluids. In particular, the present invention comprises a composition of an absorbent comprising wood pulp and optionally a super absorbent polymer, a binder system, and up to 50% hollow synthetic fibers based on the total composition weight. The composition of the present invention has an improved loft, compression resistance and fluid intake rate superior to existing composites based on natural absorbents and non-hollow synthetic fibers.

Diapers, incontinent pads, sanitary napkins, and other absorbent pads used for uptaking bodily fluids generally consist of several layers. A hydrophilic top layer is generally employed for rapid uptake of any insulting fluid. This is often followed by a high lofted bulky layer. The bulky layer is not provided with any liquid absorbing capacity in itself, but rather serves to disperse the insulting liquid to a broader surface area of the next layer, the absorbent core. This engages a greater percentage of the absorbent located in the core, prevents gel blocking, and gives the absorbent core a greater liquid storage capacity. The bulky layer is often a hydrophobic composition, in order to prevent strikethrough and rewet. The absorbent core
